

ConTEXt

title : ConTEXt User Module
subtitle : Miscelaneous
author : Wolfgang Schuster
date : February 8, 2008

```

1 \writestatus{loading}{Context User Module / Miscelaneous}
2 \unprotect
3 \def\????ac{\@cac} % ACcount

```

This is the second version of my T-Account module. If I want to be true I wrote this module the n-th time but the current version is my second version that has all things implemented that I wanted and is written as a real CONTeXt module and in a simple plain T_EX style, although it is sometimes better to try writing things for plain T_EX and creating an extended for CONTeXt later, after everything works.

The next two count registers save the values for the values from the `\debit` and `\credit` macros. You can output the values at the end of the account.

```

4 \newcount\!!creditsum
\newcount\!!debitsum

```

The following dimens are needed to save the textwidth in the first run with my account parser and feed these values into the account boxes, most of them only needed for the `width=fit` option.

```

5 \newdimen\!!debitwidth
\newdimen\!!debitheight
\newdimen\!!creditwidth
\newdimen\!!creditheight
\newdimen\!!accountwidth
\newdimen\!!accountheight
\newdimen\!!debittextwidth
\newdimen\!!debitnumberwidth
\newdimen\!!credittextwidth
\newdimen\!!creditnumberwidth

```

I collect the content from the debit environment in an box and put the content into the main box, after all values are collected. The same happens for the credit environment and his content.

```

6 \newbox\debitbox
\newbox\creditbox

```

And the last thing is a private token register to save the account content and use it for both parsing the content and using it afterwards to fill the box with the processed content.

```

7 \newtoks\accounttoks

```

This nice thing was taken from `core-rul.tex`.

```

8 \def\accountparameter#1%
{\csname\@account#1\endcsname}

```

```

\startACCOUNT [...] [...] ... \stopACCOUNT
          OPTIONAL
1  IDENTIFIER
2  inherits from \setupACCOUNT

```

```

\startAC..
\stopACC..

```

My first version used a buffers to store the content between the `\startACCOUNT ... \stopACCOUNT` pair. This has worked untill I tried to put the environment into a float or to put a few of them side

by side in an `combination` environment. A solution for this problems could have been to call the output from my `ACCOUNT` environment by a command like `\useACCOUNT` like the `MPgraphics`, but is was not what I wanted and the only solution for this was to use an delimited environment on the one side or collect the text into braces like `\ACCOUNT` on the other side. The second way would have made it easier to define new macros to for the account with presets with the `sideeffect` to enclose the content with braces. The first way avoids braces and uses delimitercommands instead, more to write and harder to define wrapper macros (in the way I like) but I prefered this solution as shown below.

```

```

To draw background for the account environment with commands in METAPOST style and the the TeX style with backslashes you can see following synonyms in your graphics. The way to define these commands were taken from `meta-init.tex`.

```

11 \startMPextensions
    color AccountRuleColor;
\stopMPextensions

12 \startMPinitializations
    AccountRuleColor:=\MPcolor{\accountparameter{c!framecolor}};
%
    AccountMaxWidth:=\MPaccountmaxwidth;
    AccountMaxHeight:=\MPaccountmaxheight;
%
    AccountTextWidth:=\MPaccounttextwidth;
    AccountNumberWidth:=\MPaccountnumberwidth;
%
    AccountWidth:=\MPaccountwidth;
    AccountHeight:=\MPaccountheight;

```

```

%
AccountHeaderHeight:=\MPaccountheaderheight;
AccountFooterHeight:=\MPaccountfooterheight;
%
AccountDebitHeight:=\MPaccountdebitheight;
AccountCreditHeight:=\MPaccountcreditheight;
%
AccountRuleWidth:=\the\dimexpr\accountparameter{c!rulethickness}\relax;
\stopMPinitializations

13 \defineoverlay
  [account]
  [\useMPgraphic{account}]

```

We are not limited to simple rules with T_EX primitives. The following METAPOST example graphic shows one way to draw more complicated rules behind the T-Account, you can use thus as an example for your own backgrounds.

```

14 \startuseMPgraphic{account}
  AccountNumberGap=0.5*AccountMaxWidth-AccountWidth;

15 z11 = (0,AccountMaxHeight-AccountHeaderHeight) ;
  z12 = (AccountMaxWidth,AccountMaxHeight-AccountHeaderHeight) ;

16 z21 = (AccountWidth-AccountNumberWidth-AccountNumberGap,AccountMaxHeight-
  AccountHeaderHeight-AccountDebitHeight) ;
  z22 = (0.5*AccountMaxWidth,AccountMaxHeight-AccountHeaderHeight-
  AccountDebitHeight) ;
  z23 = (AccountMaxWidth-AccountNumberWidth-AccountNumberGap,AccountMaxHeight-
  AccountHeaderHeight-AccountCreditHeight) ;
  z24 = (AccountMaxWidth,AccountMaxHeight-AccountHeaderHeight-AccountCreditHeight) ;

17 z31 = (AccountWidth-AccountNumberWidth-AccountNumberGap,AccountFooterHeight) ;
  z32 = (0.5*AccountMaxWidth-AccountNumberGap,AccountFooterHeight) ;
  z33 = (AccountMaxWidth-AccountNumberWidth-AccountNumberGap,AccountFooterHeight) ;
  z34 = (AccountMaxWidth,AccountFooterHeight) ;

18 z41 = (0.5*AccountMaxWidth,AccountMaxHeight-AccountHeaderHeight) ;
  z42 = (0.5*AccountMaxWidth,0) ;
  z43 = whatever[z41,z42]=whatever[z22,z23] ;

Miscellaneous

Example

A simple example:

```
\startTACCOUNT[left=S,middle=Bilanz,right=H]
\startDEBITS
  \debit [Auto] {2000}
  \debit [Bus]  {5000}
\stopDEBITS
\startCREDITS
  \credit [Bank]  {1000}
  \credit [Kasse] {200}
  \credit [Kasse] {200}
\stopCREDITS
\stopTACCOUNT
```

This results in the following output:

S	Bilanz		H
Auto	2000	Bank	1000
Bus	5000	Kasse	200

40 \protect \endinput

Miscelaneous

```
\setupACCOUNT 8          \stopACCOUNT 1  
\startACCOUNT 1
```
